

Abstract

A beverage-holding device is disclosed. The device includes a beverage holder coupled to a glove. The beverage holder is adapted to receive and support a beverage container, and is coupled to the glove by one or more fastening mechanisms, which may be fixed or selectively releasable mechanisms. In some embodiments of the invention, the holder is pivotally coupled to the glove. When not being used to support a beverage container, the holder may be stowed in an out-of-the-way position, such as on the back of the glove.
